GESNERIACEAE Dumort.

Sarder Nasir Uddin

Acaulescent or caulescent herbs, shrubs, occasionally epiphytes or rarely trees. Leaves simple, usually opposite, or rarely alternate or whorled or basal, rosette forming, those of a pair equal or unequal, plants sometimes with one leaf, entire or dentate, rarely shallowly to deeply lobed, pinnately or rarely palmately veined; exstipulate. Inflorescence usually axillary or terminal, simple or compound, dichasial cymes, rarely racemose, subcapitiate or solitary flowers, bracts small or absent; usually pedunculate. Flowers large and showy, hermaphrodite, often protandrous, zygomorphic or rarely actinomorphic, sometimes cleistogamous with reduced corolla. Calyx (4 or) 5-lobed or divided to the base. Corolla 5-(rarely 4) merous, gamopetalous, with a distinct tube, limb often 2-lipped, lobes imbricate, adaxial pair usually interior. Stamens 2 or 4, rarely 5, inserted on the corolla tube, anthers free or coherent, thecae 2, parallel, divergent, or divaricate, staminodes 1-3 or absent. Disk annular or cupular, rarely absent. Ovary superior, 1-celled with 2 parietal bilamellate placentae, usually inrolled, styles simple, stigmas simple or variously lobed, ovules numerous, anatropous. Fruits often a linear capsule, splitting loculicidally, valves straight or twisted, rarely a berry, indehiscent. Seeds numerous, fusiform to ellipsoid or ovoid, minute, sometimes hair-like appendages at either end, with or without endosperm; embryo straight, cotyledons equal or unequal after germination.

A family of over 3000 species belonging to 133 genera, mainly pantropical in distribution with only a few species in temperate region (Wang *et al.*, 1998). In Bangladesh, the family is represented by 11 genera and 28 species.

KEY TO THE GENERA

- | | |
|--|----------------------|
| 1. Fruits indehiscent berries, fleshy to leathery | Rhynchotechum |
| + Fruits dehiscent capsules | 2 |
| 2. Plants from tubers | Chrysothemis |
| + Plants without tubers | 3 |
| 3. Leaves of a pair strongly different in size (anisophyllous); calyx plicate between lobes; corolla tube campanulate, spurred or saccate at base; stamens 4; ovary depressed globose or subglobose | Stauranthera |
| + Leaves of a pair subequal or leaves alternate; calyx not plicate; corolla tube funnelform to tubular, base usually not swollen, rarely saccate, sometimes gibbous abaxially; stamens (1 or) 2 or 4; ovary linear to oblong | 4 |

4. Capsule shorter than calyx; ovary ovoid to depressed globose **5**
 + Capsule much surpassing calyx; ovary usually linear to oblong, rarely ellipsoid **6**
5. Stem leaves 1 to few, alternate; inflorescences sympodial or scorpioid, racemose; **Rhynchoglossum**
 + Stem leaves many, opposite; flowers axillary, solitary or rarely 2 flowered; **Achimenes**
6. Fertile stamens 4 **7**
 + Fertile stamens 2 **8**
7. Seeds with subulate or hairlike appendage at both end; corolla tube narrowly tubular to funnelform-tubular or subtubular, longer than limb; ovary linear; stamens adnate to corolla tube near or above middle, anthers usually coherent in pairs **Aeschynanthus**
 + Seeds without hairlike appendage; corolla tube campanulate, shorter than to slightly longer than limb; ovary ovoid, ellipsoid, or conical; stamens adnate to corolla near or slightly above base, anthers free or all 4 coherent together **Boeica**
8. Capsule valves spirally twisted or seldom straight, if straight leaf blade abaxially woolly, pannose, or velutinous, hairs dense, interwoven, usually branched **Paraboea**
 + Capsule valves straight, not twisted; leaf blade abaxially strigose or puberulent to villous, velutinous, or woolly **9**
9. Leaves in a 4-merous whorl on top of stem; flowers crowded in a terminal bunch, almost sessile; capsules linear or elongate-lanceolate, valves 2 straight not 4-valved **Tetraphyllum**
 + Leaves placed along stem; flowers with distinct pedicels; capsules narrowly lanceolate, valves 2 straight soon again bipartite (capsule usually subequally 4-valved). **10**
10. Stigma abaxial, shortly bifid **Henkalia**
 + Stigma terminal, undivided **Didymocarpus**

Achimenes Vahl

Symb. Bot. 2: 71. 1791.

Type species: *A. sesamoides* Vahl.

Perennial, terrestrial, pubescent or glabrous herbs from scaly rhizomes. Stems simple. Leaves opposite or ternate, petiolate; lamina subequal or unequal, thin, dentate or serrate. Inflorescence axillary; pedicels solitary or geminate or 1-several on a common peduncle. Calyx tube turbinate, adherent to the ovary, lobes 5, entire. Corolla usually salverform, funnelform, sometimes campanulate; tube erect or oblique in calyx, often saccate or calcarate at base; limb regular or bi-labiate, lobes 5, broad. Stamens 4, didynamous, filaments insert near the base of the corolla tube, anthers united to form a square, thecae distinct; a small staminode often present. Disc annular, often cuplike, usually entire, rarely divided and appearing lobate, glabrous. Ovary half or almost wholly inferior, style elongated, stigma stomatomorphic or distinctly bi-lobate. Fruits capsular, convex or short-conic at apex, bi-valvate. Seed small, numerous.

Achimenes longiflora DC., Prodr. 7(2): 536. 1839. *Achimenes jaureguia* Warsz. ex Haage, Fl. Serres Jard. Eur. 5: t. 536. 1849. *Achimenes kleei* Paxton, Paxton's Mag. Bot. 16: 289. 1849. *Achimenes margarita* Siebert & Voss, Vilm. Blumengärtn. ed. 31: 791. 1894. *Achimenes pauciflora* Oerst., Kongel. Danske Vidensk. Selsk. Skr., Naturvidensk. Math. Afd. V, 5: 91. 1861. *Achimenes tyrianthina* Voss, Vilm. Blumengärtn. ed. 31: 792. 1894. *Gesneria longiflora* Moc. & Sessé ex DC., Prodr. 7: 536. 1839. *Trevirana longiflora* (DC.) D.Dietr., Syn. Pl. 3: 568. 1842. **Fig. 1**.

English: Cupid's Bower, Magic Flower, Monkey-Faced Pansy, Orchid Pansy.

Perennial, rhizomatous herbs, 10-30 cm tall. Stem terete, green to reddish brown, white pilose. Leaves simple, opposite or ternate, short-petiolate (6 mm), the blades ovate to lanceolate, 2-8 × 1.3-3.0 cm, apex acute, base cuneate, slightly unequal, margins dentate-serrate, pilose throughout, green above, purple beneath; petioles 0.1-0.5 cm long. Flowers axillary, solitary or rarely 2 flowered; common peduncle absent, the pedicel solitary, 4-7 mm long. Sepals 5, free, lanceolate, 1.0-1.4 cm long, acuminate, pilose, hairs denser towards base. calyx tube 2-3 mm long. Corolla actinomorphic, purplish-violet to pinkish-purple, tube 3.0-4.5 cm long, lobes 5, unequally spreading, 6-8 cm broad, obtuse. Stamens 5, epipetalous, 2.0-4.5 cm long, filaments filiform; anthers

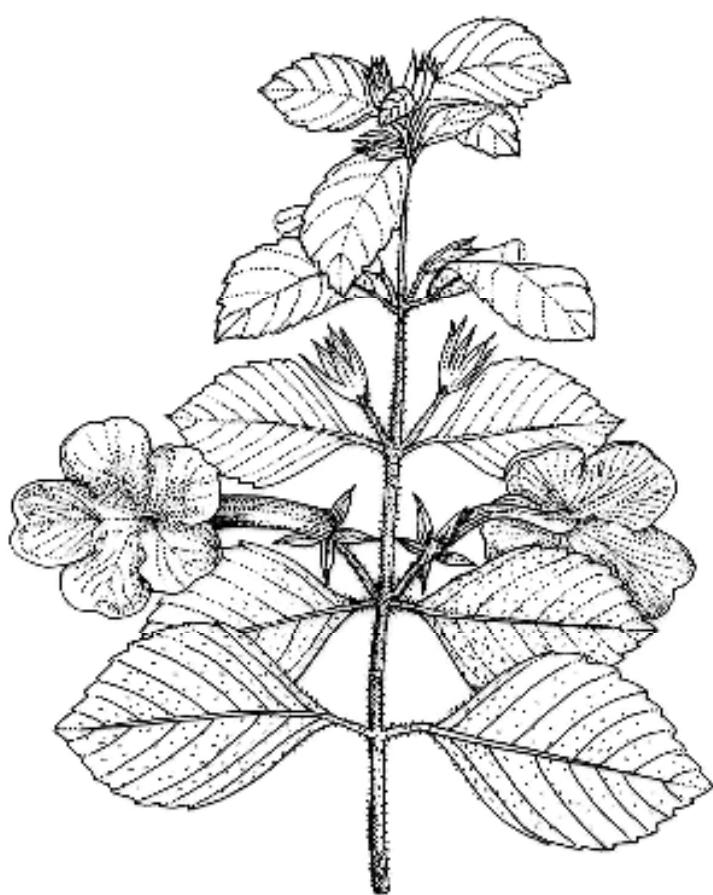

Figure 1. *Achimenes longiflora* DC., flowering shoot.

notched, 2-celled, opening by apical slits. Cerpels 2, united; style 3.0-4.3 cm long, hirsute; stigmatic lobes 2, ovary 2-celled. Fruit a globose capsule, 2-4 mm diameter. Seeds many, rugose. *Fl. & Fr.*: 6-10. *Grows on stones, walls or sometimes on sandy soils.*

Dhaka: Fular Road, Dhaka University Campus, 7 i 1981, Mofiz s.n. (DACB).

Guatemala, Mexico, Bolivia and also introduced in India.

The plant was introduced in the garden of Dhaka.

Aeschynanthus Jack

Trans. Linnean Soc. London 14: 42. 1823.

Type species: *A. volubilis* Jack

Epiphytic or lithophytic shrubs or climbers. Stems often pendent, branched or unbranched. Leaves usually many, opposite, rarely in whorls of 3-4, fleshy or leathery, equal to subequal in a pair; leaf-blades glabrous, rarely pubescent, base cuneate to rounded or attenuate, entire or dentate, veins obscure. Inflorescence axillary, pseudoterminal or terminal, lax or sometimes dense, 1-10 flowered, dichasial or clustered, umbellate cymes, bracts 2, opposite, caducous. Calyx actinomorphic, tubular or campanulate, shallowly to deeply 5-lobed, segments equal, rarely unequal. Corolla red to orange, seldom greenish, yellow, or white, zygomorphic, tubular-funneliform, showy, curved, 0.4-1.5 cm in diameter, inside sparsely glandular puberulent, glabrous, or with a hair ring; limb 2-lipped, upper lobes erect, 2-lobed; usually equalling, occasionally to half length of abaxial lip, lower ones larger and reflexed, 3-lobed, lobes equal or subequal, apex rounded to acute. Stamens 4, didynamous, exserted; anthers basifixd, usually coherent in pairs at apex, thecae parallel, dehiscing longitudinally; connective not projecting; staminode 1 or absent, adnate to adaxial side of corolla tube. Disk cupular or annular. Ovary unilocular, stipitate, oblong or linear, styles slender, stigmas capitate; placentas 2, parietal. Capsules long linear, cylindrical, 2-valved, loculicidally dehiscent, valves 2 or 4, straight. Seeds minute, ellipsoid, rugose or papillate, with 1 or more hairlike appendages, one at the apex.

KEY TO THE SPECIES

- | | | |
|----|---|-----------------------|
| 1. | Corolla inside with 5 tufts of hairs above base; seeds with 20-25 hairlike appendages at hilar end | A. longicaulis |
| + | Corolla inside glabrous to pubescent, without tufts of hairs; seeds with 1 or 2 hairlike appendages at hilar end | 2 |
| 2. | Calyx (3-) 5-lobed, tube at least 2 mm long | 3 |
| + | Calyx 5-lobed, without tube | 6 |
| 3. | Corolla 2-3 cm long; calyx red-purple or tinged red-purple | 4 |
| + | Corolla 4-6 cm long; calyx green | |
| 4. | Leaf blade 2.5-4.0 cm wide, base broadly cuneate, apex acuminate; bracts 5-9 mm long | A. hookeri |
| + | Leaf blade 1.0-2.4 cm wide, base attenuate, apex caudate or caudate-acuminate; bracts up to 3 mm long | 5 |
| 5. | Corolla tube less than 4 cm long | A. parviflorus |
| + | Corolla tube more than 4 cm long | A. radicans |
| 6. | Leaf blade 10-20 × 5-10 cm; cymes 5-15-flowered; bracts persistent, 4.0-5.5 cm long; calyx segments 2-3 cm long; corolla 5.5-8.5 cm; capsules 30-50 cm long | 7 |
| + | Leaf blade 1.5-12 × 0.5-6.0 cm; cymes 1-7-flowered; bracts deciduous or persistent, 0.2-3.0 cm long; calyx segments 0.2-1.8 cm; corolla 1.5-4.2 cm; capsules 3-29 cm long | 8 |
| 7. | Inflorescence up to 6 mm long; bracts linear | A. longiflorus |
| + | Inflorescence 38-60 mm long; bracts ovate or elliptic | A. superbus |
| 8. | Bracts persistent, ovate to suborbicular; calyx segments ovate to ovate-oblong | A. acuminatus |
| + | Bracts persistent or deciduous, linear to ovate; calyx segments linear to lanceolate, elliptic, or subulate | 9 |
| 9. | Bracts persistent, 10-30 mm long, red to purple; calyx red, 11-20 mm long | A. bracteatus |
| + | Bracts deciduous, 2-13 mm long, green; calyx green, sometimes tinged reddish or reddish, 3-10 mm long | A. micranthus |

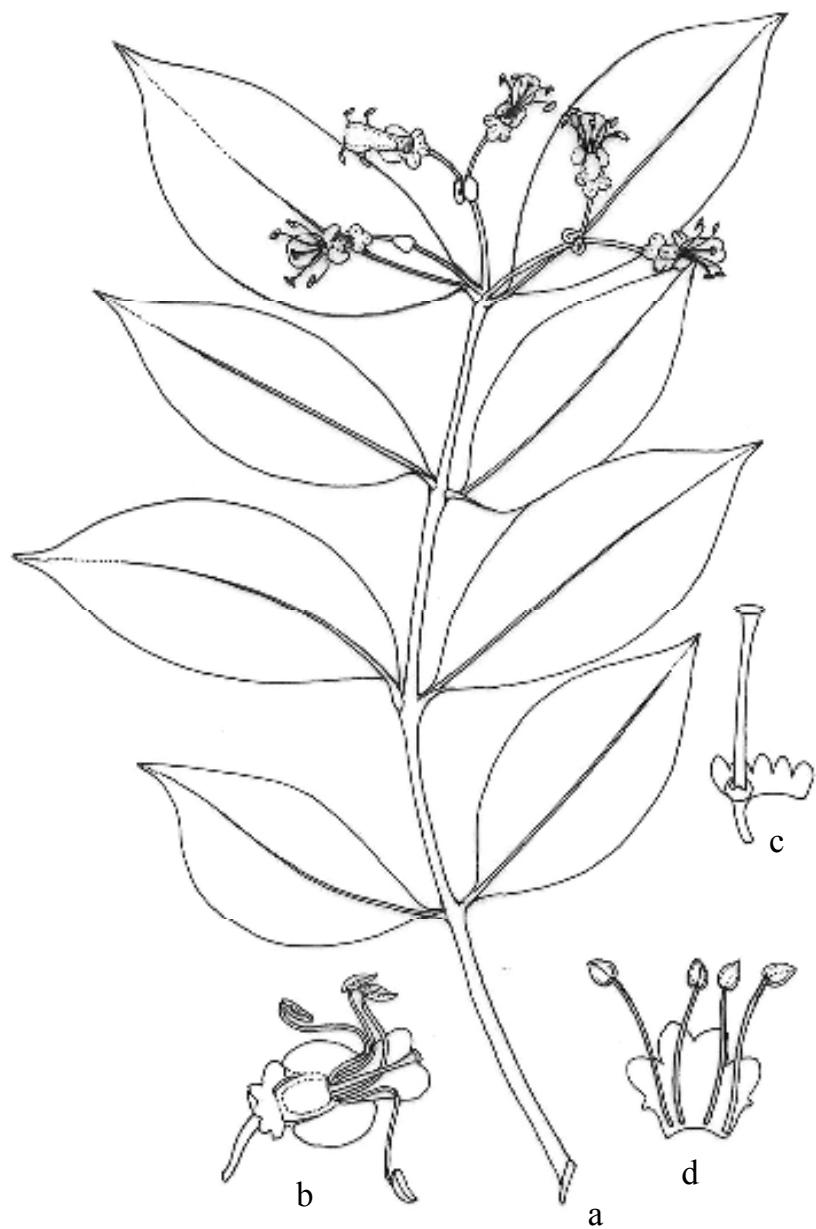

Figure 2. **Aeschynanthus acuminatus** Wall. ex A. DC., a) flowering shoot; b) flower; c) opened calyx with pistil; and d) opened corolla with stamens.

Aeschynanthus acuminatus Wall. ex A. DC., Prodr. 9: 263. 1845. C.B. Clarke, Commelyn. Cyrtandr. Bengal. t. 45. 1874; C.B. Clarke in Hook.f., Fl. Brit. India 4: 341. 1884; Cowan & Cowan, Tree North Beng.: 96. 1929; Kanjilal *et al.*, Fl. Assam 3: 391. 1939 (reprint 1982); Hara *et al.*, Enu. Fl. Pl. Nepal 3: 133. 1982; Wang *et al.*, Fl. China 18: 377. 1998; Hilliard, Fl. Bhutan 2(3): 1300. 2001; Burtt, Thai Forest Bull. (Bot.) 29: 83. 2001; Kress *et al.*, Checkl. Myanmar 261. 2003. *Aeschynanthus chinensis* Gardner & Champ., Hooker's J. Bot. Kew Gard. Misc. 1: 328. 1849. *Aeschynanthus bracteatus* Benth., Fl. Hongk. 258. 1861. *Aeschynanthus acuminatus* var. *chinensis* (Gardner & Champ.) C.B. Clarke in A. DC. & C. DC., Monogr. Phan. 5(1): 31. 1883. *Trichosporum acuminatum* Kuntze, Revis. Gen. Pl. 2: 477. 1891. *Trichosporum acuminatum* Matsum., Index Pl. Jap. 2(2): 578. 1912. **Fig. 2.**

Creeping or pendent epiphytes, sometimes lithophytes. Stems 25-150 cm long, glabrous. Leaves opposite; petiole 2-10 mm long, glabrous; leaf blade lanceolate to elliptic or narrowly oblanceolate, rarely obovate, 3.5-12.0 × 1.4-6.5 cm, base cuneate to obtuse, apex acuminate, margins entire to shallowly crenulate, thin papery to leathery, glabrous, adaxially drying smooth, abaxially sparsely punctate, 4-8 pairs of secondary veins, tertiary veins indistinct. Inflorescences axillary or terminal, 2-5-flowered cymes; peduncle 0.8-4.0 cm long; bracts persistent, reddish, ovate to orbicular, 3-10 × 2-20 mm; pedicel 7-12 mm, glabrous. Calyx green or green with purple tips, 5-sect from base, segments ovate to ovate-oblong, spreading to recurved, 2.5-4.5 × 2-3 mm, outside glabrous. Corolla 1.5-2.5 cm long, tube broad at base, mouth strongly oblique and consequently large, externally tube green, yellowish-green, or green with faint brown lines, lobes brown, greenish-yellow or green tinged with brown-red, internally paler; limb distinctly 2-lipped, upper lobes oblong or ovate, slightly spreading, 4.5-7.5 × 3.2-6.0 mm, sinus 3-5 mm deep, apex rounded; lateral lobes ovate or deltoid, reflexed, 5-8 × 6.0-8.5 mm, apex rounded or obtuse; lower lobe oblong or elliptic, reflexed, 5-9 × 3-6 mm, apex rounded, outside glabrous except for ciliate lobes, inside with sparse glandular hairs throughout including on base of lobes and in throat, with sessile glands running down tube under lower 3 lobes. Stamens exserted, fused in 2 pairs; filaments 1.5-2.5 cm long, various shades of purple or red, glabrous or with few sessile glands; anthers coherent in pairs at apex, 3.0-3.5 × 1.5-2.0 mm, purple; staminode 1.2-3.5 mm long; pollen green. Disk 1.5-2.2 mm high, 5-crenate. Pistil 1.5-2.4 cm long, stipe 2-7 mm long, glabrous; ovary green, 9-22 mm long, glabrous. Style pink or green, 4-7 mm long,

glabrous. Capsules 10-20 cm × 2-3 mm. Seeds 1.0-1.5 × 0.2 mm, smooth, with 1 hair like appendage at each end, appendages 3.0-3.5 mm long. 2n = 32 (Kokubugata and Yokota, 2017). *Fl. & Fr.*: 10-5. *Grows on trees or streamside rocks in evergreen forests; 100-1000 m altitudes.*

East Bengal: locality & date unknown, W.Griffith, 3806 (CAL 331192). **Sylhet:** locality & date (1832) unknown, N.Wallich, 6397 (K-000831876).

Bhutan, India, Nepal, Myanmar, Thailand, Laos, Vietnam, Taiwan, China and Malaysia.

Plant has potential horticultural value.

Aeschynanthus bracteatus Wall. ex A. DC., Prodr. 9: 261. 1845. C.B. Clarke in Hook.f., Fl. Brit. India 4: 342. 1884; Cowan & Cowan, Tree North Beng.: 96. 1929; Kanjilal *et al.*, Fl. Assam 3: 391. 1939 (reprint 1982). *Aeschynanthus paxtonii* Lindl., J. Hort. Soc. London 4: 79. 1849. *Aeschynanthus peelii* Hook.f. & Thoms., Ill. Himal. Pl. t. 17. 1855. *Aeschynanthus bracteatus* var. *peelii* (Hook.f. & Thoms.) C.B. Clarke, Commelyn. Cyrtandr. Bengal. t. 44. 1874. *Trichosporum bracteatum* Kuntze, Revis. Gen. Pl. 2: 477. 1891. **Fig. 3.**

Stems 25-150 cm long, glabrous. Leaves opposite; petiole 5-20 mm long; leaf blade broadly lanceolate to elliptic, ovate, or obovate, 4-12 × 1.5-6.0 cm, base cuneate to rounded or subcordate, apex caudate to acuminate, margin entire to shallowly dentate, frequently undulate, sometimes revolute, leathery to papery, glabrous, upper surface drying wrinkled or smooth, lower surface few punctate, lateral veins indistinct. Cymes axillary or pseudoterminal, 2-7-flowered; peduncle 2-7 cm long; bracts usually persistent, red to purple, lanceolate to ovate, 1.5-3.0 × 0.5-1.5 cm. Pedicel 6-12(-20) mm long, glabrous. Calyx red, 5-sect from base; segments linear to lanceolate, 10-20 × 2-4 mm, outside glabrous. Corolla red to pink or purple, 3.2-4.2 cm long, glabrous, mouth strongly oblique; limb indistinctly 2-lipped; adaxial lip erect, 6-8 mm wide; abaxial lip reflexed, 6-8 mm wide. Stamens exserted; filaments 2.2-2.5 cm long; anthers coherent in pairs at apex, 1.8-2.5 mm long; staminode ca. 0.5 mm long. Pistil 2.5-3.0 cm long; ovary glandular puberulent; style 4-6 mm long, glandular puberulent. Capsule 7-15(-20) cm long. Seeds with 1 hairlike appendage at each end, appendages 1.8-3.0 mm long.

Figure 3. *Aeschynanthus bracteatus* Wall. ex A. DC., a) flowering shoot; b) opened flower; c) pistil; d) capsule; and e) seed.

$2n = 18$ (Yuanxue *et al.*, 2002) *Fl. & Fr.*: 6-1. *Grows on streamside cliffs and trees in hilly forests; between 500-800 m altitudes.*

East Bengal: locality & date unknown, W.Griffith, 3807 (CAL 331246). **Sylhet:** locality & date unknown, F. De Silva, 794 (K-001111907).

Bhutan, India, Myanmar and China.

Plant has potential horticultural value.

Aeschynanthus hookeri C.B. Clarke, Monogr. Phan. 5: 21. 1883. C.B. Clarke in Hook.f., Fl. Brit. India 4: 338. 1884; Cowan & Cowan, Tree North Beng.: 96. 1929; Kanjilal *et al.*, Fl. Assam 3: 388. 1939 (reprint 1982); Hara *et al.*, Enu. Fl. Pl. Nepal 3: 133. 1982; Uddin in Ahmed *et al.*, Encycl. Fl. Fauna Bangladesh 8: 237. 2009. *Aeschynanthus parasiticus* C.B. Clarke, Commelyn. Cyrtandr. Bengal. t. 49. 1874; Hara *et al.*, Enu. Fl. Pl. Nepal 3: 133. 1982. *Trichosporum hookeri* Kuntze, Revis. Gen. Pl. 2: 477. 1891. **Fig. 4.**

Epiphytic shrubs, laxly branched. Stem up to 1 m long, slender, glabrous, pendent, rooting mainly at lower nodes. Leaves simple, opposite, fleshy; leaf blades narrowly elliptic to oblong, 6-11 × 1.5-4.0 cm, apex acuminate, base cuneate, margin entire, adaxially drying smooth or wrinkled, abaxially not punctate, lateral veins indistinct; petioles 7-13 mm long. Inflorescence pseudoterminal cymes, 4-10-flowered; peduncle absent; bracts persistent, green, triangular to lanceolate, 5-9 × 1.5-3.0 mm; pedicel 1.0-1.5 cm long, glabrous. Calyx tube 8-14 mm long, 5-lobed from above to near middle, lobes mostly one-third length of the tube, 3-6 mm long, ovate to broadly triangular, 3-7 × 2-3 mm, outside glabrous obtuse, red or purple. Corolla glandular, pubescent outside, inside glabrous, 3-4 cm long, tube curved near the apex, inflated, limb indistinctly 2-lipped, lips nearly equal, ca. 4.5 mm long, all 5 lobes projecting forwards, mouth almost round and slightly oblique, throat yellow, rest of corolla bright scarlet or orange scarlet, each lobe with a conspicuous dark purplish median line running back halfway down the tube. Stamens far-exserted, anticus filaments glandular-puberulous; filaments 2.6-3.0 cm long; anthers coherent in pairs at apex, 2.5-3.0 mm long; staminode ca. 1 mm long. Pistil ca. 3 cm long; ovary glabrous; style ca. 1.2 cm long, puberulent. Fruits about 30 cm long. Seeds about 1 mm long, with two long delicate hairlike appendages at hilar end,

English: Tiger Striped Lipstick, Zebra Lipstick, Zebra Basketvine

Epiphytic, pendulous herbs. Stems up to 45 cm long, glabrous. Leaves opposite; sessile or shortly petiolate; leaf blade elliptic to lanceolate or oblanceolate, 6-12 × 2.0-3.5 cm, base cuneate, apex acuminate, margin undulate-crenulate, papery to leathery, glabrous, adaxially drying wrinkled, abaxially sparsely punctate, lateral veins indistinct. Inflorescence axillary cymes, 1-3-flowered; peduncle absent; bracts deciduous. Pedicel 0.5-1.7 cm, glabrous. Calyx green, 5-lobed from base; lobes linear-lanceolate, 8-15 × 1-2 mm, outside glabrous. Corolla yellow-green, 1.4-2.0 cm long, outside glabrous, inside with 5 tufts of hairs below middle, mouth not oblique; limb indistinctly 2-lipped, lips nearly equal, 2-4 mm long. Stamens exserted; filaments 1.2-1.6 cm long; anthers coherent in pairs at apex, 2.0-2.5 mm long. Pistil 3.2-3.6 cm long; ovary glabrous; style 1.8-2.2 cm long, sparsely puberulent. Capsule 15-35 cm long. Seeds with 20-25 hair-like appendages at hilar end, appendages 1-2 cm long. $2n = 28, 30$. *Fl.* & *Fr.*: 10-2. *Grows on tree trunks in forests; 500-800 m altitudes.*

English: Lipstick Plant

Epiphytes with arching stems, glabrous. Leaves opposite; petiole 5-15 mm long, glabrous; blade ovate or elliptic, 3.5-17.5 × 1.5-6.5 cm, base rounded to cuneate, apex acuminate to caudate, margin entire, fleshy or coriaceous, dark green above, pale green beneath, glabrous, secondary veins 3-8 pairs, obscurely visible. Inflorescences terminal, 2-5-flowered cymes; peduncle absent; bracts linear, 3-6 mm long; pedicels 10-15 mm long, brownish-green or purplish, glabrous. Calyx of separate lobes free to base, unequal, green to dark red or purplish, glabrous or sparsely hairy, sometimes ciliate at margins, 5-20 mm long; lobes linear, narrowly triangular, narrowly ovate or oblong, erect, 5-20 × 1-2 mm, apex obtuse to acuminate. Corolla 4-9 cm long, tube narrow at base; externally bright red or dark red, internally tube cream-coloured, lobes bright red; upper lobes orbicular, oblong or ovate, 3-8 × 3-5 mm, sinus 3-6 mm deep, apex rounded; lateral lobes oblique ovate or deltoid, 3.2-7.5 × 5.5-9.0 mm, apex rounded; lower lobe ovate, not spreading or reflexed, 6-12 × 4-6 mm, apex rounded; outside glabrous to sparsely glandular puberulent, usually with ciliate lobes, sparsely glandular hairs inside. Stamens long exserted, fused in 2 pairs; filaments reddish, purple or pink, pubescent, anthers pale pink; anterior filaments inserted at 5-6 cm from corolla base, filaments 3-5 cm long, anthers 3.5-5.0 × 1-2 mm; posterior filaments inserted at 5-6 cm from corolla base, filaments 2-4 cm long, anthers 2.4-3.6 × 1-2 mm; staminode 1-5 mm long. Disk 1.0-1.5 mm high, 5-crenate. Pistil 4-8 cm long; stipe 1.5-2.0 mm long, glabrous to sparsely minutely papillose; ovary 2-3 mm long, minutely papillose puberulent; style purple or purplish-pink, 1.5-3.5 mm long, glandular pubescent to papillose. Capsule 20-60 cm × 3-4 mm. Seed grain 1.5-1.8 × 0.3-0.4 mm, warty, apical appendage a filiform hair, 1.5-2.5 mm long; hilar appendage a single filiform hair, 1.5-2.5 cm long; appendages papillose. 2n = 30 (Fedorov, 1969). Fl. & Fr.: 5-10. In primary evergreen, hilly forests, or in disturbed forests; between 200-1000 m altitude.

The plant can be used as an ornamental plant.

Figure 11. **Aeschynanthus superbus** C.B. Clarke, flowering & fruiting shoot.

Boeica C.B. Clarke

Commelyn. Cyrtandr. Bengal. 118. 1874.

Type species: *B. fulva* C.B. Clarke

Perennial, terrestrial, rhizomatous or stoloniferous herbs or subshrubs. Leaves few to many, alternate, spaced along stem or tufted at apex or rarely forming a basal rosette; petiolate; leaf blade ovate to elliptical, base cuneate to attenuate, puberulent to densely woolly or glabrescent. Inflorescences axillary, lax or dense, umbel-like, 1 to many flowered cymes; bracts 2 and opposite, rarely several and whorled. Calyx actinomorphic, 5 lobed; segments equal, free or fused halfway. Corolla campanulate or flat-faced, 3-7 mm in diameter; limb slightly zygomorphic, upper lip 2-lobed, lower lip 3-lobed, lobes (sub)equal, rounded or acute, white to pink or blue to purple, inside glabrous or puberulent. Stamens 4, inserted near corolla base; filaments short; anthers basifix, free, thecae subparallel, confluent at apex, dehiscing longitudinally, poricidally, or transversely; connective not projecting; staminode 1, adnate to adaxial side of corolla tube. Disc ringlike or inconspicuous. Ovary ovoid or conical, 1-loculed; placentas 2, parietal, projecting inward, 2-cleft. Stigma 1, terminal, capitate, undivided. Capsule straight in relation to pedicel, linear to narrowly oblong, much longer than calyx, dehiscing loculicidally to base; valves 2, straight, not twisted. Seeds unappendaged.

Boeica filiformis C.B. Clarke, Commelyn. Cyrtandr. Bengal. 118. 1874. C.B. Clarke in Hook.f., Fl. Brit. India 4: 362. 1884; Kanjilal *et al.*, Fl. Assam 3: 397. 1939 (reprint 1982). *Chelone filiformis* Buch.-Ham. ex C.B. Clarke, Monogr. Phan. 5: 134. 1883. **Fig. 12.**

English: Thread-like Boeica.

Perennial subshrubs or herbs, up to 2 m tall, rhizomatous, sometimes stoloniferous. Leaves few to many, alternate, crowded near stem apex; leaf blade oblanceolate or obovate, elliptic-lanceolate, 12-18 × 3-6 cm, base cuneate to attenuate, apex acuminate, margins minutely dentate, glabrous to glabrescent, lateral nerves about 9 on either half; petiole 8-10 mm long. Inflorescences lax, axillary, many-flowered cymes; peduncles solitary, 10-15 cm long with capillary branches and pedicels, glabrous; bracts 2, linear and opposite. Calyx actinomorphic, 5-sect from base; segments equal, narrowly

Figure 12. **Boeica filiformis** C.B. Clarke, flowering shoot.

triangular to linear-lanceolate, 2.0-2.5 mm long, outside puberulent, margin entire. Corolla dark pink to white, zygomorphic, inside glabrous or puberulent; tube campanulate, sometimes saccate at base, slightly shorter than limb, 3-7 mm in diameter; limb 2-lipped; adaxial lip 2-lobed, shorter than to abaxial lip; abaxial lip 3-lobed, lobes equal or subequal, apex rounded to acute. Stamens 4, adnate to corolla near base, included; anthers basifix, purple, free, thecae subparallel, confluent at apex, dehiscing longitudinally, poricidally, or transversely; connective not projecting, filaments ca. 1.5 mm long; staminode 1, adnate to adaxial side of corolla tube. Disc ringlike or inconspicuous. Ovary conical, 1-loculed; placentas 2, parietal, projecting inward, 2-cleft; stigma 1, terminal, capitate, undivided. Capsule straight in relation to pedicel, linear to narrowly oblong, 8-12 mm long, glabrous, dehiscing loculicidally to base, valves 2, straight, not twisted. Seeds unappendaged. *Fl. & Fr.*: 7-11. *Hilly forests, along the spring; 300-600 m altitudes.*

The plant has an ornamental value.

Chrysanthemis Dence

Rev. Hort. (Paris), 3: 242. 1849.

Type species: *C. pulchella* (Donn ex Sims) Decne.

Terrestrial or rarely epiphytic, caulescent, erect or sometimes decumbent herbs, tuberous. Stems unbranched. Leaves opposite, equal or subequal in a pair, venation pinnate, foliar nectaries absent. Flowers axillary (but appearing terminal by exceeding stem apex), 1-9-flowered cymose or umbellate, pedunculate inflorescences, with small leafy bracteoles; pedicellate. Calyx lobes 5, basally connate into a tube; corolla yellow to orange, with orange or reddish lines or spots, cylindric, lobes 5; stamens included, filaments basally connate, anthers sometimes coherent, dehiscing by longitudinal slits, thecae parallel;

staminode absent; disc a single dorsal, 2-lobed gland; ovary superior, stigma 2-lobed. Fruit a fleshy, brown capsule, loculicidally dehiscent, 2- to several-valved, valves opening slightly.

Chrysanthemis pulchella (Donn ex Sims) Decne. in Rev. Hort. (Paris) 21: 242. 1849.

English: Sunset bells, Black Flamingo, Copper Leaf, Chrysanthemis.

Terrestrial herb, 5-40(-90) cm tall. Stem succulent, erect when young, decumbent with age, densely puberulent to pilose towards apex, glabrescent below. Leaves equal in a pair; petiole <1-3.5 cm long, puberulous to pilose; blade membranous to papyraceous when dry, lanceolate, elliptic to ovate to oblong-ovate, 9-30 x 3-14.5 cm, margin crenate or dentate, apex acute, base short to long decurrent into petiole, above sparsely pilose to subscabrous, or villous, below pilose to puberulous. Flowers in umbellate, 3-9-flowered inflorescences; peduncle <1.5(-5) cm long, puberulous to pilose; pedicel 1.0-2.5 cm long, puberulous to pilose. Calyx tubular-campanulate, not inflated, base rounded, 5-angled or -winged, orange to red, tube 1-1.8 cm long, free portion of lobes erect, subequal, broadly triangular, 0.25-0.5 x 0.35-0.5 cm, margin glandular-denticulate, apex abruptly acuminate, outside pilose to villous, inside glabrous or rarely pubescent. Corolla erect in calyx, orange or yellow, 1.6-3 cm long, tube cylindric, base gibbous, 0.3-0.6 cm wide, middle ampliate, throat not constricted, 0.3-0.5 cm wide, outside glabrous near base, white sericeous above, inside glandular pubescent, limb 1-1.5 cm wide, lobes subequal, spreading, suborbicular, 0.3-0.8 x 0.3-0.8 cm, margin entire; stamens included,

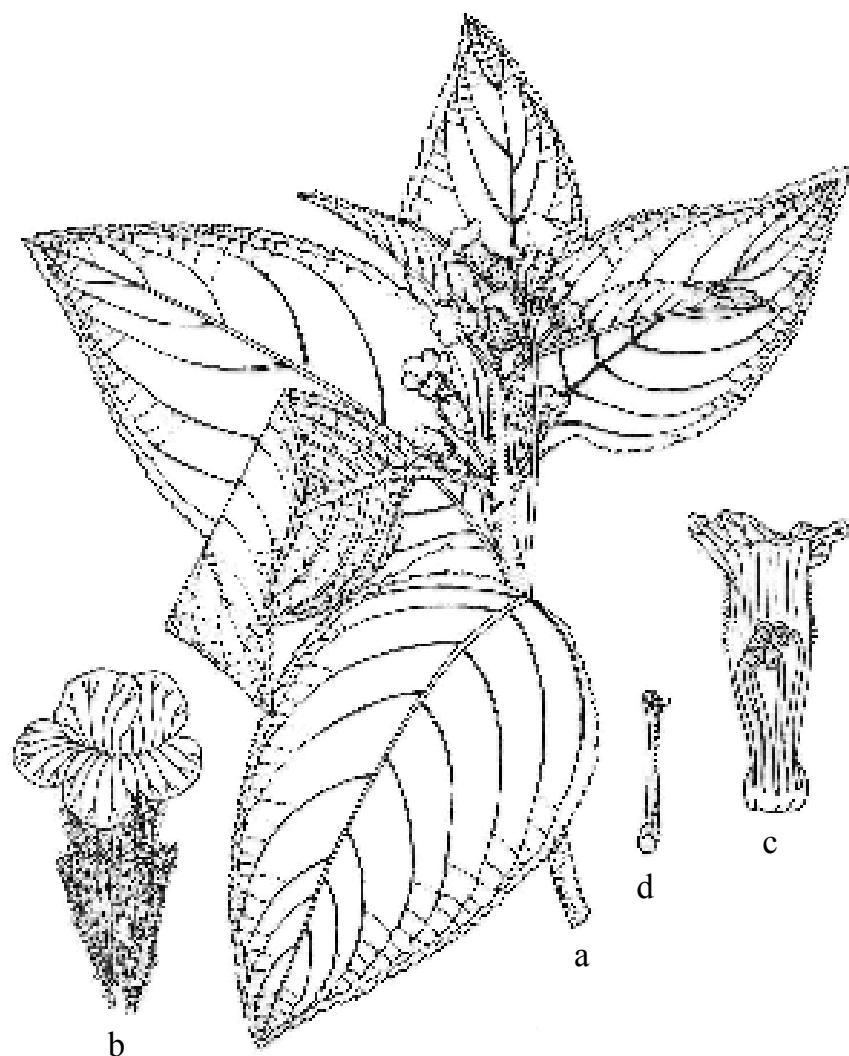

Figure 13. *Chrysanthemis pulchella* (Donn ex Sims) Decne., a) flowering shoot; b) flower; c) opened corolla with stamens; and d) pistil.

inserted at base of corolla tube; ovary conic, $0.2-0.4 \times 0.2-0.3$ cm, pubescent, style 0.7-1.1 cm long, glabrous, stigma deeply 2-lobed. Mature capsule yellow-green, ovoid, ca. 0.6×0.6 cm. $2n = 18$ (Fedorov, 1969). *Fl. & Fr.*: 5-9. *Well drained and shady-moist gardens.*

Dhaka: Sisso Academy Garden, Ramna, 16 x 2002, Mokarram Hossain 01 (DACB).

West Indies, Nicaragua to Panama, Colombia to the Guianas and Brazil.

This introduced species can be used as a house plant or interior ornamental plant.

Didymocarpus Wall.

Edinburgh Philos. J. 1: 378. 1819.

Type species: *D. aromaticus* Wall.

Perennial, terrestrial or epipetric, rhizomatous, acaulescent or caulescent herbs, rarely shrubs or subshrubs. Leaves simple, opposite, whorled, or alternate or basal, equal to subequal in a pair; leaf blade sparsely to densely puberulent to pubescent, rarely nearly glabrous, short strigose, or woolly, base cuneate to cordate, rarely auriculate.. Inflorescence axillary scapose, paniculate, sometimes umbel-like, lax or sometimes dense, 1- many flowered cymes; bracts 2, opposite. Calyx actinomorphic, small, 5-lobed or partite, or zygomorphic and 2-lipped, 5- or 3-lobed from base to shallowly lobed; segments equal to unequal. Corolla zygomorphic, campanulate, tube cylindric to funnelform-tubular, 2-13 mm in diameter, curved, oblique at the throat, inside glabrous, rarely sparsely puberulent, limb 2-lipped; adaxial lip 2-lobed; abaxial lip 3-lobed, lobes equal or central lobe longer, apex rounded, rarely obtuse to acute, blue to wine-red, rarely pink, white, or yellow. Fertile stamens 2, adnate to abaxial side of corolla tube near or above middle, inserted near the base of corolla tube, filaments short, curved, glabrous, anthers dorsifixed, connate, applanate, bilocular, locules confluent, dehiscing longitudinally; staminodes 2, rarely 3, small, swollen at the tip, adnate to adaxial or adaxial and abaxial sides of corolla tube. Disk ringlike, rarely cupular. Ovary linear, sessile or stalked, unilocular with 2 intruding, recurved, parietal placentae; styles slender; stigmas oblique, subcapitate or flattened, depressed-globose to disc-like or truncate,

undivided, rarely 2-lobed. Fruit a linear capsule, much surpassing calyx, loculicidally dehiscent into 2-4 valves. Seeds small, ellipsoid, smooth or minutely reticulate.

List 802. 1829. *Babactes oblongifolia* A.DC., Prodr. 9: 260. 1845. **Fig. 14.**

Perennial herbs. Stems erect, 40-90 cm, rust-brown puberulent apically. Leaves opposite, widely spaced along stem; petiole 1.5-4.5 cm long; leaf blade ovate to elliptic or oblong, 6-18 × 5-10 cm, base oblique, cuneate to cordate, margin denticulate, apex acuminate, papery, densely puberulent, densely yellow glandular, lateral veins 8-13 on each side, conspicuous. Cymes 5-7-flowered; peduncle 2-4 cm long, densely rust-brown puberulent; bracts 2, free, narrowly ovate, densely puberulent, margin denticulate, apex acute. Pedicel 0.5-1.5 cm long, densely rust-brown puberulent. Calyx 1.0-1.5 cm long, 5-lobed from above middle; tube 7-9 mm long; lobes equal, triangular, 3-5 mm long, outside densely puberulent and glandular, inside glabrous with very short hairs near apex, margin entire, apex acute to acuminate. Corolla white with yellow at throat, 4.0-4.5 cm, outside sparsely puberulent, inside glabrous; tube funnelform; adaxial lip 4-7 mm broad; abaxial lip 0.9-1.2 cm broad. Filaments 1.2-1.4 cm long, glabrous; anthers fused by entire adaxial surfaces, ca. 1.5 mm long, glabrous; staminodes 3. Pistil ca. 2.5 cm long, puberulent; ovary ca. 2 cm long; stigma obdeltoid, 2-5 mm long, emarginate or 2-lobed. Capsules erect, 5-7 cm long. *Fl. & Fr.*: 8-10. *Hilly evergreen forests; between 400-800 m altitudes.*

Annual herbs. Stem up to 20 cm tall, densely villous, near the base hirsute with fulvous deflexed hairs. Leaves simple, opposite, or the 4 uppermost sub-vorticillate; petioles 8-10 mm long or absent; leaf blades ovate-elliptic or elliptic, 8-12 × 4-5 cm, base cuneate, apex acute, margin crenate, membranous, glabrous above, hairy beneath or at least on the nerves, nerves 9-11 pairs. Inflorescence subterminal, 10-12 flowered, lax or paniculate cymes; peduncles 8-10 cm long; pedicels 0.4-0.6 cm long, pubescent; bracts lanceolate. Calyx very deeply divided, segments linear, 2.5-3.0 mm long, obtuse, pubescent. Corolla tube slightly gibbous at the base, slightly constricted at the throat, 8-10 mm long, pinkish-violet with prominent darker veins, glabrous, lower 3 lobes 4-6 mm long, upper 2 lobes 3-4 mm long, rounded. Filaments glabrous, 2.5-3.0 mm long, anthers glabrous, staminodes 2 or 3, slightly swollen at the tip. Disk shortly cylindric. Ovary oblong, glabrous, styles glabrous, stigmas capitate, 3 mm long. Fruits folicular, linear, 10-15 × 2-3 mm, sessile, dehiscing symmetrically into 2-valves, glabrous. *Fl. & Fr.:* 6-10. *Shady banks and rock-faces in the forests; between 300-1000 m altitudes.*

Sylhet: locality & date unknown, N.Wallich, 790 (K-001111903)

India, Myanmar and Bhutan.

Leaves are used for fomenting in case of swellings and pain on the ankle and wrist.

Stems 5-25(-40) cm long, densely puberulent to glabrescent. Leaves opposite; petiole 0.3-1.2 cm long; leaf blade narrowly ovate to ovate, oblong, or obovate, 1-15 × 1-10 cm, herbaceous, base oblique, broadly cuneate to cordate, apex acute to rounded, margins crenate to crenulate or nearly entire, adaxially appressed puberulent, eglandular, abaxially puberulent along veins, eglandular, lateral nerves 5 or 6 pair. Inflorescence 1-15-flowered cymes; peduncle 1-12 cm, sparsely glandular puberulent; bracts free, ovate to orbicular, often leaflike, 0.2-2 cm long, glabrous to puberulent, yellow glandular, margin crenate to entire; pedicel 4-10 mm long. Calyx slightly zygomorphic, 3-6 mm long; limb indistinctly 2-lipped; tube 2-4 mm long; adaxial lip 3-lobed, depressed trapeziform, ca. 2 mm wide, lobes triangular, 1-2 × 1.0-1.2 mm; abaxial lip 2-lobed, depressed trapeziform, 2-3 mm wide, lobes triangular, 1-2 × 1.8-2.0 mm, outside sparsely puberulent, inside glabrous, margin entire. Corolla purple to reddish purple with darker stripes, 2.5-3.5 cm long, outside sparsely pubescent, inside glabrous; tube narrowly funneliform, 20-28 × 4-6 mm; adaxial lip 3-4 mm wide; abaxial lip 6-8 mm wide. Filaments 6-8 mm long, glabrous; anthers 1.8-2.0 mm long, sparsely pubescent; staminodes 3, 1.2-5.0 mm long. Pistil 2.3-3.2 cm long, glabrous; ovary 7-8 mm long. Capsules 3-4 cm long. *Fl. & Fr.*: 6-10. *On rocks and cliffs in valleys; between 500-800 m altitudes.*

Henckelia Spreng.

Arbeit. 2: 405. 1817.

Type species: *H. incana* (Vahl) K.P.J. Spreng.

Perennial or rarely annual herbs. Stems erect, ascending or creeping. Leaves opposite, alternate or whorled, shortly to long petiolate, lamina form very variable, ranging from ribbon-like to suborbicular, often ovate or lanceolate, sometimes pinnately lobed, usually

Figure 16. **Didymocarpus punduanus** Wall. ex R.Br., flowering shoot.

hairy. Inflorescences axillary, 1–15-flowered cymes, pedunculate; bracts paired, free or connate, caducous. Sepals 5, triangular or narrowly triangular, free to base or basally connate. Corolla variously colored, often with yellow markings in throat, often infundibuliform, rarely campanulate or flat-faced, bilabiate with 2-lobed upper lip and 3-lobed lower lip. Stamens 2, usually included in the corolla, filaments long, often with an apical spur, anthers cohering. Nectary cylindrical, cup-shaped, sometimes lacking. Ovary usually slender conical or ovoid; stigma chitoid. Fruit usually a long plagiocarpic capsule, held horizontally and splitting into 2 valves or opening only along the dorsal side. Seeds numerous, with various testa patterns.

Perennials, rhizomatous herbs. Stemless or up to 5 cm long, rust-brown pilose. Leaves 4-6, along stem or crowded at apex, alternate; petiole 2-17(-25) cm long; leaf blades oblique, ovate to suborbicular, 5-19 × 3.7-13 cm, herbaceous, adaxially sparsely white pubescent, eglandular, abaxially leaves often purplish, especially along veins, rust-colored pilose, especially along veins, base oblique, cordate to rounded, margin dentate

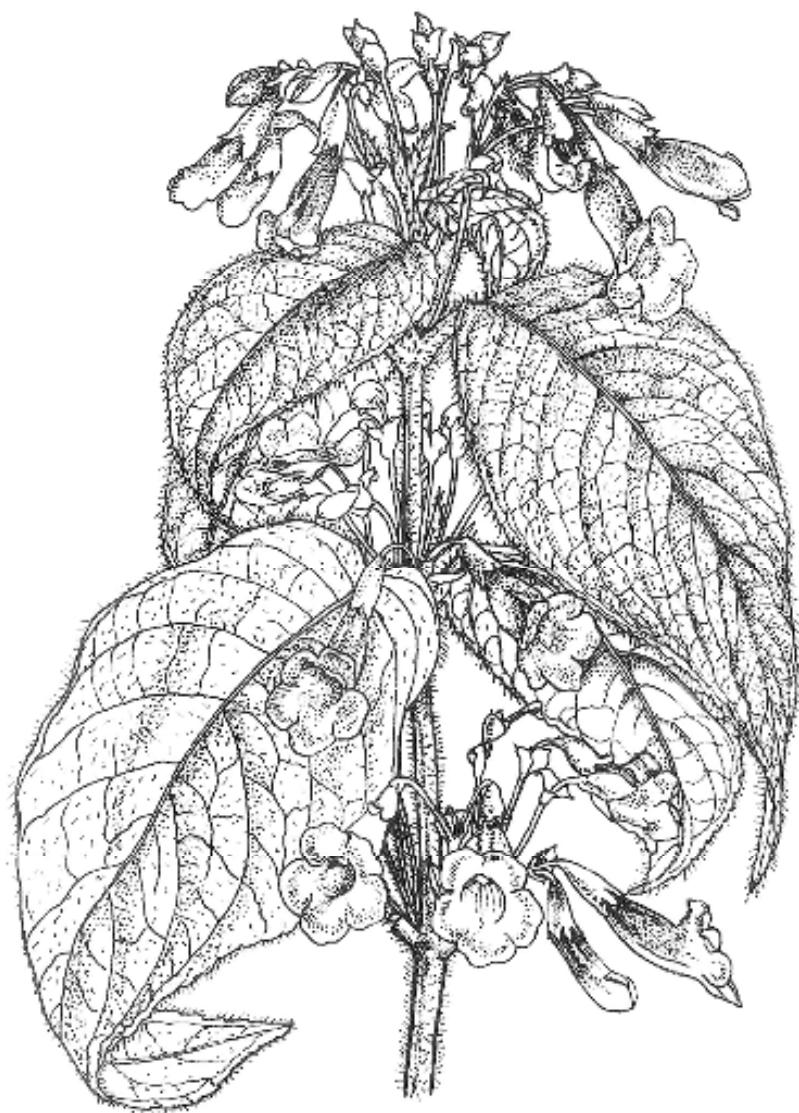

Figure 20. **Henckelia speciosa** (Kurz) D.J. Middleton & Mich.Möller, flowering shoot.

to serrate or crenate, apex acuminate to rounded; lateral veins 6-9 on each side, conspicuous. Inflorescence 1-6-flowered cymes; peduncle 3-15 cm long, rust-brown pubescent to villous; bracts 1 or 2, free, narrowly ovate to oblong, 6-15 × 1-4 mm, rust-brown villous, margin entire to serrulate, apex acute; pedicel 0.8-2.0 cm long, rust-brown pubescent. Calyx 1.0-2.5 cm long, 5-lobed from above to near middle; tube 5-10 mm long; lobes unequal, narrowly triangular, 0.7-1.5 cm × 3-4 mm, outside rust-brown pubescent to villous, inside glabrous, margin entire, apex subulate-acuminate. Corolla blue-purple with yellow marks within tube, 4.5-6.5 cm long, outside sparsely puberulent to pilose, inside puberulent; tube narrowly funneliform, 3.5-4.5 × 1.2-1.8 cm; adaxial lip 1.0-1.2 cm broad; abaxial lip 1.6-1.8 cm broad. Filaments 9-11 mm long, glabrous to sparsely pubescent; anthers fused by entire adaxial surfaces, 4.0-6.5 mm, densely puberulent; staminode 1. Pistil 3.0-3.5 cm long, puberulent; ovary 2.0-2.4 cm long; stigma flabellate, 3-4 mm long, bi-lobed. Capsules 7-9 cm long. $2n = 18$ (Yuanxue *et al.*, 2002). *Fl. & Fr.*: 3-7. *On wet rocks: between 300-700 m altitudes.*

East Bengal: locality & date unknown, W.Griffith, 3828 (CAL 333030).

India, Myanmar, Thailand, Vietnam and China.

Paraboea (C.B.Clarke) Ridl.

J. Straits Branch Roy. Asiat. Soc. 44: 4, 63. 1905.

Type Species: *P. clarkei* B.L. Burtt.

Perennial, epipetric or terrestrial, rhizomatous, rosulate or caulescent herbs. Stems often woody at base, branched, occasionally monocarpic, woolly when young. Leaves opposite, alternate or whorled; upper surface glabrous, glabrescent, or with scabrous hairs; lower surface mostly with a densely matted indumentum. Inflorescence axillary, subterminal or terminal, 1 to many-flowered cymes. Calyx equally divided almost to base into 5 lobes. Corolla obliquely campanulate or with a short tube and flat limb, bilabiate, white, blue or violet. Stamens 2, inserted in the corolla tube; filaments thick; anthers robust, bright yellow; staminodes present or not. Ovary cylindrical, distinct or not from the style; stigma usually small, terminal. Fruit a capsule, dehiscent along margins, straight or spirally twisted, usually cylindrical or slightly flattened. Seeds unappendaged.

Paraboea multiflora (R. Br.) B.L. Burtt, Notes Roy. Bot. Gard. Edinburgh, 41(3): 433. 1984. *Boea multiflora* R.Br., Pl. Jav. Rar. 120. 1840; C.B. Clarke in Hook.f., Fl. Brit. India 4: 365. 1884; Kanjilal *et al.*, Fl. Assam 3: 398. 1939 (reprint 1982). *Didymocarpus multiflorus* Wall., Numer. List 793. 1829. **Fig. 21.**

Perennial, rosulate herbs. Stems woody or not, rhizome up to 20 cm long. Leaves congested in a rosette or sometimes caudate on an extending rhizome; petiole 1-12 cm long; blades unequal, elliptic or rarely ovate, 4-22 × 3-9 cm, apex obtuse, base cuneate or slightly cordate, margin crenate, upper surface glabrescent or pubescence, lower surface with a greenish or ferruginous matted indumentum; lateral nerves 10-15 pairs. Inflorescence axillary, many-flowered cymes, 5-25 cm long; peduncle 4-20 cm long, bracts inconspicuous; pedicels 2-7 mm long. Calyx 1.5-2.5 mm long, 5-lobed to the base, lobes ovate or narrowly ovate, 1.0-1.3 × 0.5-0.8 mm, glabrous inside, minutely greyish pubescent outside. Corolla white, 4-5 mm long, pubescent; tube c.1 mm long, limb indistinctly 2-lipped, 2 lobes of the upper lip and 3 lobes of the lower lip similar in size. Anthers ellipsoid, c. 2 × 2 mm, yellowish, basifixed; filaments inserted at the corolla base. Ovary ovoid, 2.0-2.5 × 0.8-1.2 mm, whitish to greenish farinose; style distinct from the ovary, 2-3 mm long, glabrous; stigma capitate. Fruit a narrow-ovoid capsule, 0.6-1.2 cm long, greyish to greenish farinose, spirally twisted. Seeds ovoid or ellipsoid, 2-3 × 1.5 mm. *Fl. & Fr.*: 6-9.

On limestone.

East Bengal: locality & date unknown, W.Griffith 3843 (P,W). **Sylhet:** Pundua, date unknown (1824!), F. De Silva, 793 (K-001111906).

India, Bhutan, Burma, Laos, Vietnam, Thailand and China.

Rhynchoglossum Blume

Bijdr. 741. 1826.

Type species: *R. obliquum* Blume

Perennial or annual herbs. Stems branched or simple, terete, glabrous or sparsely pubescent. Leaves few, along stem, alternate, nearly distichous, petiolate, exstipulate; leaf blade puberulent to glabrous, base sometimes strongly oblique, cuneate to cordate. Inflorescences pseudoterminal or axillary, lax or scorpioid, few to many flowered cymes

Figure 21. **Paraboea multiflora** (R. Br.) B.L. Burtt, flowering shoot.

or racemes; bract 1, opposite to each flower, alternate, sometimes absent. Calyx actinomorphic, 5-lobed, segments equal, tube infundibuliform, campanulate or urceolate, white, pale green to dark green, semi-translucent. Corolla white, blue to purple, zygomorphic, inside glabrous or sparsely puberulent near mouth; tube cylindric, not swollen; limb 2-lipped; adaxial lip 2-lobed, shorter than abaxial lip; abaxial lip 3-lobed, seldom undivided, lobes equal or subequal, apex rounded and mucronulate or acute to obtuse. Stamens 2 or 4, filament flat or terete, adnate to corolla tube near middle; anthers basifixied or dorsifixied, coherent in pairs, thecae nearly parallel or divaricate, confluent at apex, dehiscing longitudinally; connective not projecting; staminodes 2-3, or absent. Disc cupular. Ovary ovoid, 1-loculed; placentas 2, parietal; stigma 1, terminal, subglobose, undivided. Fruit a capsule, straight, globose or ovoid to elongate, dehiscing loculicidally, enclosed with calyx remnant. Seeds minute, cuneate, unappendaged.

English: Small Flowered Rhynchoglossum.

Figure 22. ***Rhynchoglossum obliquum*** Blume, flowering shoot.

Annual herbs. Stem up to 1.5 m tall, with swollen nodes, wrinkled or angular when dried, glabrous to sparsely puberulent. Leaves ovate to elliptic, 5-14 × 1.5-9.0 cm, base obliquely unequal, one side rounded to cordate, other side attenuate to cuneate, apex acuminate, margins entire or serrate, membranous, pale green, midrib puberulous, upper surface glabrous or sparsely hairy with gland dots, lower surface glabrous, young leaf brown pubescent; petiole terete, sparsely puberulous to glabrescent, 1-3 cm long. Inflorescences terminal and axillary leaf-opposed, 10-50 flowers cymes, 3-40 cm long, erect or pendulous, pubescent; peduncles 1-4 cm long; bracts linear or minute, puberulous, 2-10 mm long; pedicels 1-3 mm long, densely puberulous; bracteoles linear, 3-10 mm long, glabrous to puberulous. Flowers 8-12 mm long. Calyx tube campanulate, pale green to white, 3.0-5.5 × 1.5-3.0 mm, glabrous to glabrescent, connate at lower half, lobes 5, triangular, 1-2 mm long, acute or acuminate, white to transparent, margin entire to nearly serrate, puberulous. Corolla white, blue to dark purple or whitish blue, 0.8-1.6 × 0.4 cm, glabrous, pubescent; tube cylindric, 8-10 mm long; limb 6 mm long, upper lip emarginate or 2-lobed, 1-3 mm long; lower lip undivided, tongue-like, rounded to nearly trilobed, 3-6 mm long. Stamens 2; filaments 1-5 mm long; anthers ovoid to oblong, glabrous, basifixed; staminodes 2. Disc ca. 1 mm diameter. Ovary ovoid to oblong, 1.5-3.0 × 1 mm, glabrous; style glabrous, 5-10 mm long; stigma capitate. Fruit ovoid, 3-5 × 2-3 mm, glabrous, enclosed by persistent calyx. Seeds ellipsoid, 0.5 mm long. Fl. & Fr.: 7-11. *Forest margins, lowland secondary forests, cliffs, open area near stream; between 100-800 m altitudes.*

Rhynchotechum Blume

Bijdr.: 775. 1826.

Type species: *R. parviflorum* Blume

Terrestrial undershrubs or herbs. Stems usually simple, occasionally sparingly branched, stout, brittle, bark white, spongy, young parts silky-woolly or hispid. Leaves simple, opposite or rarely alternate, petiolate, usually few, along stem, equal to subequal in a

pair; leaf blade surfaces sericeous to hirsute or woolly, often glabrescent, base attenuate to rounded. Inflorescences axillary, lax, few to many-flowered cymes; bracts 2, elliptic, opposite. Calyx actinomorphic, very deeply 5-lobed, segments equal, persistent. Corolla white to reddish or purple, zygomorphic, small, limb shallowly campanulate from a broad shallow tubular base, inside glabrous, limb 2-lipped, upper lip smaller than the lower; 5-lobed, lobes equal or subequal, apex rounded to obtuse. Stamens 4, adnate to corolla tube near base or rarely near middle, inserted, filaments short, curved; anthers basifix, free, thecae parallel, confluent at apex, dehiscing longitudinally 2-celled, minutely glandular at the apex; connective not projecting; staminode absent or 1, adnate to adaxial side of corolla tube. Disk annular or obscure. Ovary conical to ovoid, 1-loculed; stigma 1, terminal, depressed globose, undivided; ovules enfolding, placentas 2, parietal, projecting inward, 2-cleft. Fruit a ovoid to globose berry, slightly longer than calyx, indehiscent, fleshy, white, translucent. Seeds small, ellipsoid, reticulate, unappendaged.

KEY TO THE SPECIES

- | | |
|--|----------------------|
| 1. Plant hispid, hairs stiff; calyx lobes distinctly caudate | R. vestitum |
| + Plant woolly pubescent to sub-glabrous, not hispid; calyx lobes triangular to linear acuminate | 2 |
| 2. Pedicels and calyx lobes often scabrous; ovary glabrous; style 6- 7 mm long | R. ellipticum |
| + Pedicels and calyx lobes sericeous or sub-glabrous; ovary glabrous to pubescent; style 3.5-4.0 mm long | R. hookeri |

Fig. 23.

Herbs or undershrubs. Stem up to 2 m tall, usually unbranched or sparingly branched, basally glabrescent, apically densely rust-brown woolly. Leaves opposite, deciduous on flowering parts of the stem; leaf blades oblanceolate to obovate or elliptic, 10-35 × 4-10 cm, apex acute to acuminate, base cuneate to attenuate, rarely nearly rounded, margins denticulate to serrulate, lateral nerves 10-20 pairs, upper surface glabrous to sparsely white pubescent, lower surface pale green, yellow-rusty woolly; petioles 1-5 cm long, appressed rust-brown to brown woolly. Inflorescence 15-70-flowered cymes, 3-8 cm long, fascicled, interspersed with much reduced leaves and bracts; peduncles 1-3 mm long, axes short yellow-rusty sericeous; bracts linear to triangular, 2-6 mm long; pedicels up to 1.5 mm long, hirsute. Calyx tube up to 1 mm long, lobes triangular to linear acuminate, 3-5 × 1.0-1.5 mm, outside brown woolly to pubescent, gland tipped, inside glabrous, pink to pale pink. Corolla red-purple or pink, scabrous with glandular hairs, tube 1.5-2.5 mm long; bilabiate, upper lip 3-4 × 4-5 mm, lower lip 5-7 × 7-8 mm. Stamens 4, inserted near the base of the corolla tube, 0.5-1.0 mm long; filaments short, curved; anthers 2-celled, purple, minutely glandular at the apex, staminode 1. Disk annular or obscure. Pistil 5-7 mm long, glabrous; ovary conical, 1-2 mm long; stigmas capitate. Fruit an ovoid berry, 3-5 × 3-5 mm, glabrous, white when ripe. *Fl. & Fr.*: 6-12. *Primary or secondary evergreen forests; between 100-500 m altitudes.*

Stauranthera Benth.

Scroph. Ind.: 57. 1835.

Type species: *S. grandifolia* Benth.

Perennial or annual, monocarpic, terrestrial herbs. Stem fleshy-succulent, often simple, occasionally sparingly branched, hispid. Leaves few, along stem, alternate or opposite, strongly unequal, one of each pair reduced to a small auricle; the larger leaves with short or long petiole; leaf blade elliptic to ovate, base strongly unequal-sided, oblique, cuneate to rounded, apex acute-acuminate or blunt, glabrescent to sparsely puberulent; petiolate. Inflorescence lax, pseudoterminal, few to many flowered paniculate cymes or subracemose or single-flowered cymes or solitary flowers emerging from small bracts; bracts 2, small, elliptic, opposite. Flowers pedicellate. Calyx actinomorphic, widely campanulate, deeply 5-lobed, wide spreading, plicate between adjoining lobes; lobes equal. Corolla 5-merous, white, blue, or purple, zygomorphic, tube campanulate, inside glabrous, spurred or gibbous at base, limb indistinctly 2-lipped; adaxial lip 2-lobed, nearly as long as abaxial lip; abaxial lip 3-lobed, lobes equal or subequal, apex rounded. Stamens 4, all fertile, adnate to corolla tube near base, inserted; filaments short, curved; anthers basifix, 2-celled, coherent laterally to form a shallow cone, thecae slightly divergent, confluent at apex, dehiscing longitudinally; connective not projecting. Disk absent or obscure. Ovary sessile, subglobose, 1-loculed; styles short; stigmas capitate, broadly funnelform, undivided; placentae deeply inflexed, bifid, bearing ovules on both sides. Fruits capsular, depressed-globose, overtopped by the calyx, dehiscent transversely or irregularly. Seeds very small, blackish-brown, obovoid, smooth, testa reticulate, unappendaged.

KEY TO THE SPECIES

1. Leaves opposite; peduncles 4-7 cm long; corolla 25 mm long, blue, spurred at the base **S. grandifolia**
- + Leaves alternate; peduncles less than 4 cm long; corolla 6-8 mm long, white with blue marks, gibbous at the base. **S. umbrosa**

Stauranthera grandifolia Benth., Scroph. Ind. 57. 1835. *Stauranthera grandiflora* Benth., Scroph. Ind. 57. 1835; C.B. Clarke in Hook.f., Fl. Brit. India 4: 371. 1884; Prain, Beng. Pl. 2: 785. 1903 (Indian reprint 2004); Heinig, List Pl. Chitt. 48. 1925; J.Sinclair, Fl. Cox's Bazar: 102. 1956; Uddin in Ahmed *et al.*, Encycl. Fl. Fauna Bangladesh 8: 243. 2009. **Fig. 26.**

Annual herbs, up to 30 cm tall, usually unbranched, succulent, dusky-pubescent. Leaves simple, opposite, falcate, elliptic, 18-25 × 8-12 cm, apex acute to acuminate, base cuneate, margin obscurely dentate, glabrous above, grey-pilose beneath or at least on the nerves, very unequal sided, petioles 0.5-2.5 cm long. Inflorescence paniculate cymes, terminal or rarely axillary, 5-15 cm long, peduncles 4-7 cm long; pedicels up to 1.5 cm long, both hirsute. Calyx tube widely campanulate, up to 0.8 cm long, 5-lobed, lobes half way down, triangular, 3-5 × 1.0-1.5 mm, hirsute, green. Corolla campanulate, 0.8-1.0 cm long, spurred, 2-3 mm long, blue with yellow mark inside tube. Stamens 4, inserted near the base of tube, filaments short, curved, anthers 2-celled, minutely glandular at the apex, staminode 1. Disk annular or obscure. Ovary sessile, subglobose, pubescent or glabrous, styles short, stigmas broad. Fruits capsular, depressed globose, 4-5 × 3-4 mm, dehiscing irregularly. Seeds minute, obovoid, smooth. *Fl. & Fr.: 5-9. Primary or secondary moist evergreen tropical forests, up to an altitude of 500 m.*

Annual herbs, up to 35 cm tall, occasionally branched, dusky-pubescent. Leaves simple, alternate, falcate, ovate to obovate, elliptic, 12-20 × 6-8 cm, apex acute to acuminate, base strongly oblique, cuneate to rounded, margin obscurely repand-crenate, glabrescent to glabrous above, fuscous-pubescent beneath or at least on the nerves; reduced leaves sessile, oblique, obovate, 3-4 mm; petioles 0.6-1.3 cm long. Inflorescence uniparous cymes, terminal, 5-8 cm long; peduncles 1.8-3.5 cm long, dusky-pubescent; bracts linear, 3-4 mm, adaxially puberulent; pedicels 0.6-1.2 cm long, both hirsute. Calyx tube widely campanulate, up to 0.8 cm long, 5-lobed, lobes half way down, broadly triangular, 3-5 × 1.0-1.5 mm, hirsute, green. Corolla campanulate, 0.8-1.5 cm long, gibbous, tube 2.2-2.8 × 3-4 mm; adaxial lip 3-4 mm wide, abaxial lip ca. 4-5 mm wide, white with blue marks outside or white to purple, base of the inside tube yellow. Stamens 4, inserted near the base of tube, 3-5 mm long, filaments short, curved, anthers 2-celled, minutely glandular at the apex, staminode 1. Disk annular or obscure. Pistil 1.8-2.0 mm long; ovary sessile, subglobose, densely puberulent, styles short, stigmas broad. Fruits capsular, depressed globose, 4-6 × 3.5-4.5 mm, depressed globose with persistent style, overtopped by the calyx. Seeds minute, ovoid, smooth. *Fl. & Fr.: 7-12. Primary or secondary, evergreen tropical forest margins in valleys; between 300-700 m altitudes.*

Tetraphyllum Griff.

Notul. 4: 148. 1854.

Type species: *T. bengalense* C.B. Clarke

Perennial, monocarpic herbs. Stems erect, caulescent, tawny-villose, bearing a tetramerous pseudowhorled or a single leaf pair at the top and pairs of scale leaves. Leaves simple, petiolate or subsessile; leaf blades ovate or lanceolate, unequal sided. Inflorescence densely cymose or subcapitulate, sessile or nearly so; bracts elliptic; flowers nearly sessile; bracteoles small. Sepals 5, almost free to base. Corolla widely funnel-shaped, silky hairy, pink or blue, limb bilabiate or subregular; lobes 5, subequal, ovate, obtuse. Stamens 4, didynamous, or 2; filaments adnate to corolla base; anthers coherent at the tips, opening by longitudinal slits; staminodes 3, smaller. Disk cylindric or absent. Ovary ovoid, styles linear, stigmas obscurely 2-lobed, placentae deeply intruded, 2-partite, revolute, bearing ovules on both sides. Fruits capsular, narrowly lanceolate, loculicidally dehiscent into 4 valves, leaving the two main ribs united to the persistent style base. Seeds small, ellipsoid, testa laxy, reticulate.

Tetraphyllum bengalense C.B. Clarke, Monogr. Phan. 5: 137. 1883; C.B. Clarke in Hook.f., Fl. Brit. India 4: 363. 1884; Prain, Beng. Pl. 2: 784. 1903 (Indian reprint 2004); Heinig, List Pl. Chitt. 48. 1925; Uddin in Ahmed *et al.*, Encycl. Fl. Fauna Bangladesh 8: 245. 2009. **Fig. 28.**

Annual herbs. Stem up to 40 cm tall, tawny-villous, lower part leafless. Leaves 2 pairs at the top, simple, pseudowhorled; lamina ovate-elliptic or elliptic, 15-18 × 8-10 cm, membranous, apex acute, base cuneate, unequal-sided, margin crenate, glabrous above, dusky villous beneath or at least on the nerves, nerves 8-12 pairs, petioles 8-10 mm long or longer. Inflorescence sub-terminal or axillary, 10 to 30-flowered cymes; peduncles 4-6 cm long; pedicels 0.4-0.6 cm long, pubescent. Calyx very deeply divided, segments lanceolate, 1.2-1.7 mm long, fulvous silky hairy. Corolla tube funnel-shaped, 14-16 mm long, blue, glabrous, lobes 5, ovate, 6-8 mm long, subequal. Fertile stamens 2, glabrous, filaments short, anthers sub-mucronate at the apex, 2-celled, cells ellipsoid, parallel, dehiscing by longitudinal slits, staminodes 3, smaller. Disk cylindric or absent. Ovary ellipsoid, covered with silky hairs, styles linear, stigmas obscurely 2-lobed, placentae deeply intruded, 2-partite, revolute, bearing ovules on both sides. Fruits capsular,

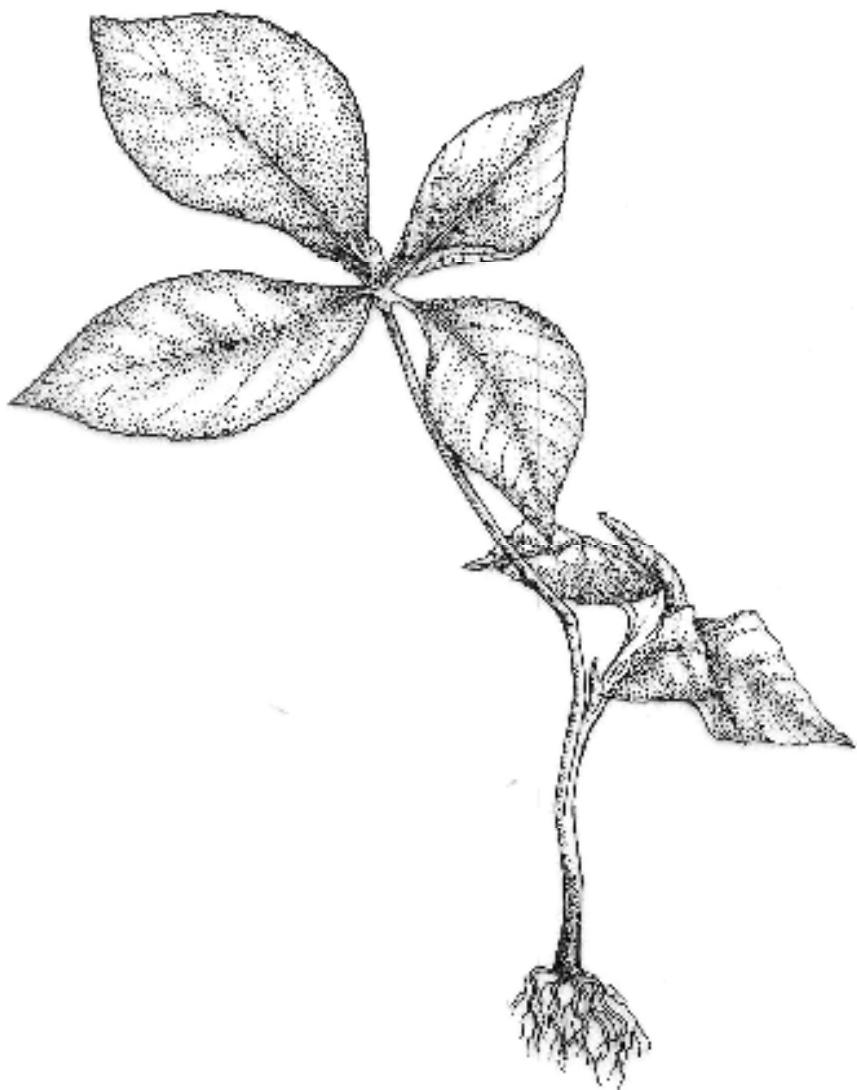

Figure 28. **Tetraphyllum bengalense** C.B. Clarke, a flowering plant.

narrowly lanceolate, 1.2-1.6 × 0.2-0.3 cm, acute, loculicidally dehiscent into 4 valves. Seeds small, ellipsoid, testa laxy, reticulate. *Fl. & Fr.*: 6-10. *Shady banks and rock-faces in the forests, between 300 to 1000 m altitudes.*

East Bengal: locality & date unknown, W. Griffith, 3830 (CAL-332031). **Moulvibazar:** Lathitilla Forest Beat, Juri, 22 ix 2014, SN Uddin & MEH Khokan N5614 (DACB). **Rangamati:** Kassalong, 13 ii 1873, CB Clarke, 19814A (K-000901027).

India, Myanmar and Bhutan.

The leaves are used for fomenting in case of swellings and pain on the ankle and wrist.
